The journey to hands-free: Our vision for agentic AI

Contents

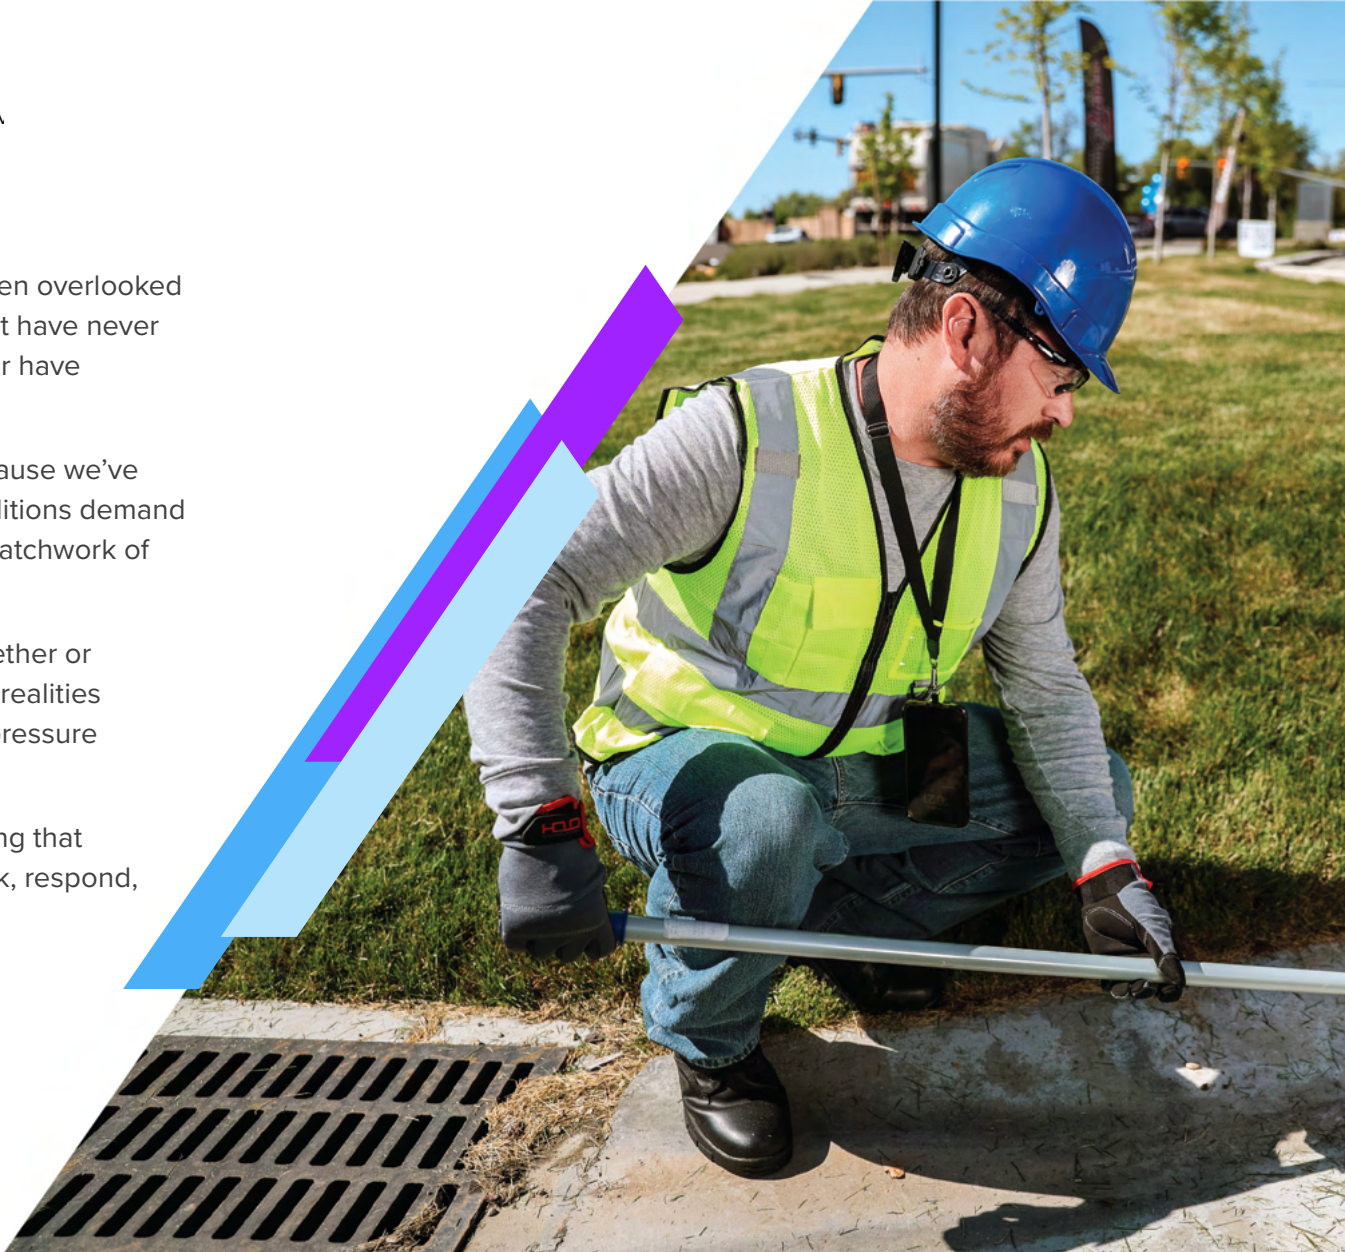

- 01** Intro
- 02** The vision: An AI-guided fieldwork experience
- 03** Why fieldwork needs it
- 04** What an AI agent does
- 05** Why Fulcrum will deliver what others only promise
- 06** If you're already on Fulcrum, you're already ahead
- 07** You in?

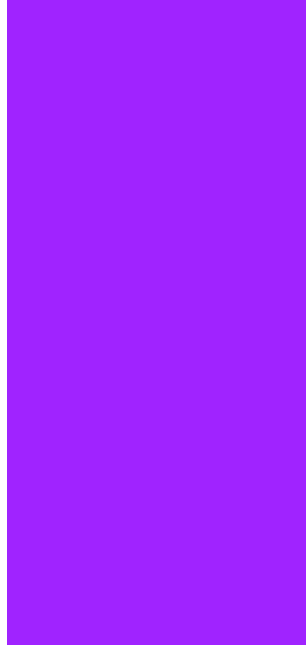

Fieldwork is critical, complex, and often overlooked by the people building software. Most have never worked outside the office, and neither have their clients.

At Fulcrum, we build for the field because we've worked in it. We know what real conditions demand and how frustrating it is to rely on a patchwork of tools pulled from other platforms.

That's why Fulcrum isn't stitched together or retrofitted. It's a platform built for the realities of fieldwork, already proven in high-pressure environments.

Now we're taking the next leap: turning that platform into something that can think, respond, and guide the work as it happens.

The vision: An AI-guided fieldwork experience

The next evolution of field technology moves beyond better screens and smarter forms.

It introduces software that pays attention to what's happening and takes initiative.

Fulcrum is building AI agents — autonomous AI assistants — for the field. These are software bots that understand context, know the workflow, and guide the work forward.

They prompt the next step, spot what's missing, surface requirements, and capture data as the work happens.

They act like knowledgeable partners: present, responsive, and aligned with the task.

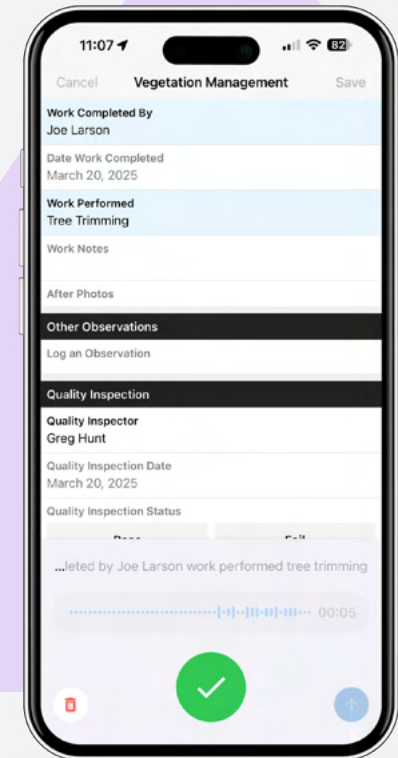

Why fieldwork needs it

Fieldwork doesn't get the attention it deserves. The tools are old. The workflows are overloaded. The expectations keep climbing, while the labor pool keeps thinning.

Regulated industries can't afford mistakes. And too often, field teams are still expected to do critical work with the digital equivalent of a clipboard and a prayer.

Until we have robots in hard hats, people will keep doing the work — and they deserve systems that actually help.

Not after the fact, and not just for the office. Right there, on the ground, while the work's happening.

What an AI agent does

An AI agent doesn't take over the job. It guides it.

It knows what has to happen, checks what's missing, and brings in safety steps and sanity checks.

It fills in data automatically when it can, and works alongside you when it can't.

It catches what's easy to miss, closes loops, and keeps the workflow moving.

That helps everyone. Field teams finish faster, more safely, with fewer mistakes. Supervisors don't have to chase down records. Reports don't need rework.

In short, the agent knows your world. That's what makes it so helpful.

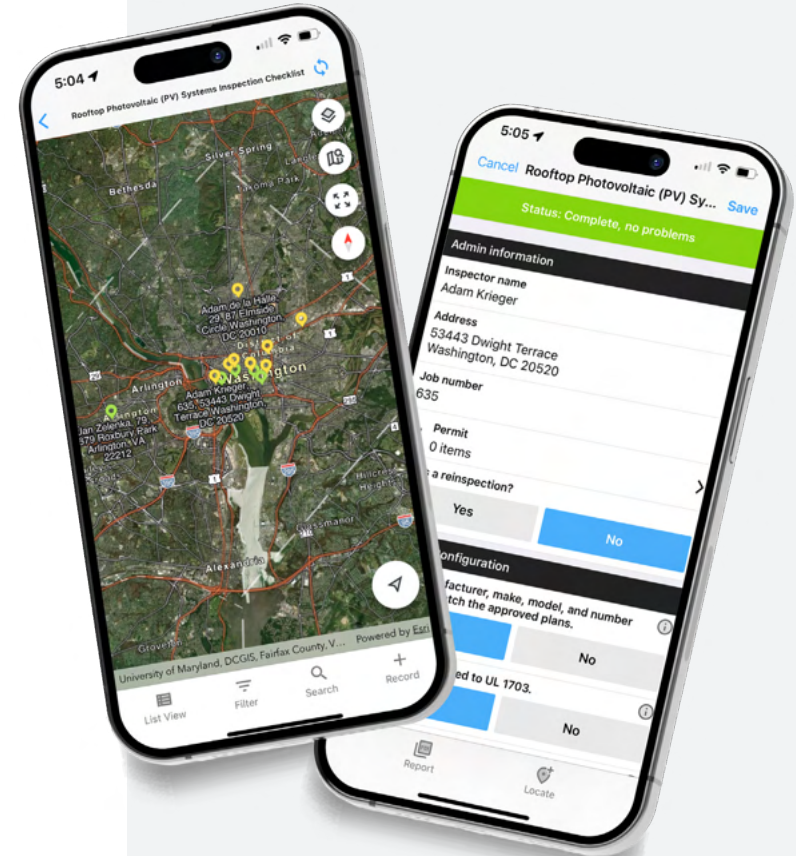

Why Fulcrum will deliver what others only promise

We've spent more than a decade working with teams in regulated, GIS-heavy, high-stakes environments. The kind where mobile isn't optional and field conditions don't wait for tech to catch up.

We've built the platform ourselves. We know what it supports, how it scales, and what it takes to evolve it without breaking the work. The AI we're adding lives inside that platform — not on top of it.

That means what we build doesn't need a reboot. It lands inside systems already running real operations.

If you're already on Fulcrum, you're already ahead

Agentic AI needs something to work with. Not just tools, but structure, context, and real operational data.

Fulcrum gives you a way to build that now on the industry-best platform for fieldwork.

Every workflow you define, every record your teams complete, every input you standardize becomes part of a system that will eventually operate with far more autonomy.

Voice entries, photos, location, logic flows — they're already supported, live, and forming the backbone of what's coming next. And the work you do today carries forward.

What you build now becomes the framework the agent will act on — not some day, but soon.

You in?

You've seen what we're building and how it connects to the work already underway.

If this direction aligns with your goals, we're ready to show you what's possible in your world.

Real systems. Field-tested capability. A clear path forward.

Let's get to work.
